

BBS Observation

The BBS Observation Module is based on Behavior Based Safety Observations. This allows for the development and distribution of observations with the flexibility to assign to specific location(s) or to the entire organization. Completing observations, the Observer can capture additional information such as Location, Department, Observer, Date of Observation, Work Shift and Product/Part. The number of observations that can be developed and answered are limitless.

Observations can be associated with Employees, Job Task, Work Area or Other. Scoring is user definable with fields such as date, time, and free form text as well as positive/negative responses. Examples of positive responses could be Safe, Yes, True and Agree whereas negative responses could be Unsafe, No, False, and Disagree. Observations that need to be accessed more often can be added to a favorite observation library for easy access.

You have the ability to track and report on the responses with reports and dashboards for a particular facility or roll up organization levels to compare the data across your organization.

As part of the AIC Platform, user have access to attach files such as supporting documentation, corrective actions, and comments.

Observation Answer Form

Location San Diego	Observed Job Task - Loading	Observation Date 2/22/2017	<input type="button" value="Edit"/>
